#### Content

#### 1 Background

- Main focus of the research
- Findings

2 Mathematical Approach

#### Background

The research has been conducted by Xiong, Zhu, DU, Zhu, Zhang, Niu, Li,

and Zhou, and they collected the data from the Yujiabao train station in China.

According to a statistical analysis of fire accidents in high-rise buildings in China in 2013:

- **③** 388,000 buildings fires caused 1637 causalities and
- a total loss of 0.71 billion dollars in property damage

#### Main focuses of the research

The research mainly focused on the following three areas:

The complexity of the indoor scene

#### Main focuses of the research

The research mainly focused on the following three areas:

- The complexity of the indoor scene
- Interview of the provide the second secon

#### Main focuses of the research

The research mainly focused on the following three areas:

- The complexity of the indoor scene
- Interview of the provide the second secon
- Itighly effective evacuation analysis

#### Basic indoor spatial model

To provide efficient indoor evacuation, a basic indoor spatial model should have the following three characteristics:

Interior structure and dynamic emergency

#### Basic indoor spatial model

To provide efficient indoor evacuation, a basic indoor spatial model should have the following three characteristics:

- Interior structure and dynamic emergency
- Ø Dynamic changes among indoor objects, and

#### Basic indoor spatial model

To provide efficient indoor evacuation, a basic indoor spatial model should have the following three characteristics:

- Interior structure and dynamic emergency
- Ø Dynamic changes among indoor objects, and
- Ongestion and stagnation prediction

# Elements Required for Indoor Emergency Evacuation

####

▶ < 불 ▶ 불 ∽ ९ ୯ April 22, 2020 6 / 19

Based on the dynamic indoor field model (DIFM), the researchers found that a 3D network can reduce the evacuation time up to **33 percent**.

#### Mathematical Approach

$$\mu_i = \begin{cases} 1.4 & \rho \le 0.75 \\ 0.0412\rho^2 - 0.50\rho + 1.867 & 0.75 < \rho \le 4.2 \\ 0.1 & \rho > 4.2 \end{cases}$$

$$\rho = \frac{n}{Area}$$

Where  $\mu_i$  is the speed of an evacuee in m/s, and

 $\rho$  is the referencing crowd density in  $\mathrm{persons}/\mathrm{m}^2, \mathit{and}$ 

n represents number of people

$$\omega_{utility} = \begin{cases} 0.0 & \text{grid is not covered by utilities} \\ 1.0 & \text{utility is a water resource} \\ \frac{s}{dis(u)} & \text{grid is cover by fire utility} \end{cases}$$

Where  $\omega_{utility}$  is the utility weight of grids, dis(u) represents the distance to the fire utilities, and s is the grid's geometric size

$$\omega_{utility} = \begin{cases} 0.0 & \text{grid is not covered by utilities} \\ 1.0 & \text{utility is a water resource} \\ \frac{s}{dis(u)} & \text{grid is cover by fire utility} \end{cases}$$

Where  $\omega_{utility}$  is the utility weight of grids, dis(u) represents the distance to the fire utilities, and s is the grid's geometric size

$$\omega_{detector} = \begin{cases} 0.0 & \text{grid is not covered by detectors} \\ -\frac{s}{dis(d)} & \text{grid is cover by detectors} \end{cases}$$

Where  $\omega_{detector}$  is the detectors weight of grids, and dis(d) represents the distance to the detectors,

$$\omega_{individual} = \left\{ egin{array}{c} 0.0 \\ -rac{1}{\mu} & {
m other \ evacuee's \ location} \end{array} 
ight.$$

Endashaw Tonja (Methodist University: IndusA Dynamic Indoor Field Model for Emergency

◆□▶ ◆圖▶ ◆臣▶ ◆臣▶ ─ 臣

$$\omega_{\textit{individual}} = \left\{ \begin{array}{ll} 0.0 \\ \\ -\frac{1}{\mu} \end{array} \text{ other evacuee's location} \right.$$

$$\omega_{\text{fire}} = \begin{cases} 0.0 & \text{grid is not in fire field} \\ -\frac{s}{\text{dis}(f)} & \text{grid is in fire field} \end{cases}$$

Where dis(f) is the distance to the fire

Image: A matrix

$$\omega_{\textit{individual}} = \left\{ \begin{array}{ll} 0.0 \\ \\ -\frac{1}{\mu} \end{array} \text{ other evacuee's location} \right.$$

$$\omega_{\text{fire}} = \begin{cases} 0.0 & \text{grid is not in fire field} \\ -\frac{s}{\text{dis}(f)} & \text{grid is in fire field} \end{cases}$$

Where dis(f) is the distance to the fire

Final weight of a grid

$$\omega_{grid} = \omega_{utility} + \omega_{detector} + \omega_{individual} + \omega_{fire}$$

э

< 冊 > < Ξ

#### The two ways that grid weight can be 0.0

- 1. The grid is not occupied by utilities.
- 2. The grid is covered by fire utilities and water resources

#### Building potential evacuation route

Optimized route from individual's location to a building exit can be

calculated by A\* search algorithm

A\* is a search algorithm that is widely used in path finding and graph traversal, the process of plotting an efficiently traversable path between points, called nodes.

#### Building potential evacuation route

Optimized route from individual's location to a building exit can be

calculated by A\* search algorithm

A\* is a search algorithm that is widely used in path finding and graph traversal, the process of plotting an efficiently traversable path between points, called nodes.

 $Route(i,j) = f(Grid, L_{(i,j)}, E_{(i,j)})$ 

#### Building potential evacuation route

Identifying potential congestion and stagnation

 $\rho = \tfrac{n}{\textit{Area}}$ 

$$Situation = \left\{ egin{array}{cc} Congestion & 
ho \in [1.5,2] \ Stagnation & 
ho > 2.0 \end{array} 
ight.$$

Identifying potential congestion and stagnation

 $\rho = \tfrac{n}{\textit{Area}}$ 

$$Situation = \left\{ egin{array}{cc} {\it Congestion} & 
ho \in [1.5,2] \ {\it Stagnation} & 
ho > 2.0 \end{array} 
ight.$$

Re-calculate evacuation route

When congestion and stagnation occur around exits, the evacuation route

must be re-calculated.

#### The new method Vs the previous method

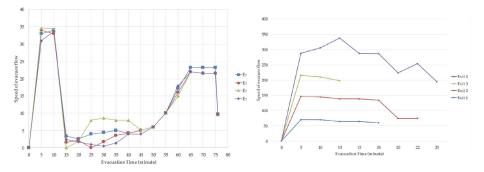

Fig 3. Speed of evacuee passing through each exist in the station with a previous model

Fig 4. Speed of evacuee passing through each exist in the station with the new 3D model

#### Future Studies

#### The proposed model can be easily applied to outdoor environments.

② Apply a detailed fire dynamic model (FDS).

In Further study on crowd flow

#### Future Studies

- The proposed model can be easily applied to outdoor environments.
- Apply a detailed fire dynamic model (FDS).
- In Further study on crowd flow

#### Future Studies

- The proposed model can be easily applied to outdoor environments.
- Apply a detailed fire dynamic model (FDS).
- Surther study on crowd flow
